

Lady of St. Pancras

Danielle Willkens*

While on an alternative photographic excursion to document poor stone consolidation techniques I was fortunate enough to capture a bit of historic preservation serendipity at New St. Pancras church. During a conservation project, the famous terra cotta caryatids were 'mummified' in bubble wrap to protect their friable surface. While passing the church on my daily route between UCL and my flat I noticed that the wrapped covering had blown to the side, revealing the expressive face within the architecture.
